## Concepts

•	Independence, dependence, and exclusivity describe the relationship between events (two or more events), and they have different mathematical meanings:
•	If two events are <b>exhaustive</b> , it means they make up the whole sample space .
	<b>The law of total probability</b> can be expressed mathematically as:
	The law of total probability is often written using the summation sign :
•	For any events A and B, we can use $\textbf{Bayes'}$ theorem to calculate $P(A B)$ :
•	P(A B) is the <b>posterior probability</b> of A <i>after</i> B happens ("posterior" means "after"). P(A) is the <b>prior probability</b> of A <i>before</i> B happens ("prior" means "before").
